

DataDrill EXPRESS Software Project Management

KEY BENEFITS:

Manage by Exception

Rely on a one-glance review to direct your attention straight to potential problems and opportunities so that you can act.

Automate Data Collection

Eliminate hunting and gathering metrics data; have accurate and consistent information reliably delivered to you.

Use Web-based Dashboards

You're never out of touch with access to all of your performance data 24/7 with just a web browser.

Apply SWPM Best Practices

Start off with ours (gained over nearly two decades) out of the box, and then add your own.

CMMI Levels 2 through 5

Make it easier to reap the benefits of CMMI implementation using our built-in metrics plus automated compliance tracking.

DataDrill empowers software managers to master their projects, allowing them to:

- understand the past
- control the present
- predict the future

Quantitative Project Management

DataDrill provides software project managers with quantitative, objective insight into all software processes, from estimation, scheduling and cost to design, requirements, coding and test.

Beginning with easy-to-use estimation and planning, DataDrill supplies managers with management by exception indicators and drillable details and analysis at any level. Quantitative project management (QPM) allows managers to see and understand the true state of their software projects, uncolored by subjective reviews or biased opinions.

Focus On The Big Picture. Understand the Details.

Projects produce a lot of data. Modern cost, schedule, requirements and development tools generate a tremendous volume of data for evaluation and analysis. DataDrill provides built-in collection and analysis to extract detailed progress information and then build top-down indicators of the big picture.

Use the terms familiar to the organization to organize indicators. Then, quickly scan across the entire project portfolio. Drill into details through indicator lists, dashboards, graphs and snapshot grids.

Without quantitative and timely status information, software project managers can't find and control areas that need attention.

Get Started Quickly

DataDrill is designed to help project managers get every project up and running quickly. Drawing from its library of best practices, DataDrill provides a collection of indicators and dashboards covering the most popular software project metrics. Create tailored project templates with just the relevant indicators and management techniques.

A built-in planning wizard lets you quickly populate project targets. Define and tailor project reporting so periodic reports provide just the information you need. Assign security to each project so only users who need access get it.

Be The First To Know

With DataDrill, managers are the first to know about significant changes in their project. Managers receive email messages when important events occur in their project. Project managers can subscribe to only those of interest, or all of them. As DataDrill collects, analyzes and updates status, managers receive an email with a direct DataDrill hyperlink into the affected area.

Analyze

Managers need to spend time analyzing critical project data. Using DataDrill's web front end, managers can navigate to trouble spots, assess changes and propose alternatives. DataDrill makes it easy to document corrective actions or root causes along the way using built in form and free-text data. And when needed, managers can easily update the project estimate or plans.

Communicate

Delivering accurate and timely project status information to customers, managers and other stakeholders is essential.

With 24/7 web access and tailorable, one-click reporting in Excel, Word, PowerPoint and Acrobat formats, managers can easily communicate status, issues and solutions.

With an extensive library of indicators and best practices, DataDrill can be deployed and tailored quickly.
